

PHASE 1 – BRAINSTORMING & IDEATION PHASE

Project Title

Implement Client Script & UI Policy (Incident)

Introduction

The Implement Client Script & UI Policy (Incident) project focuses on improving the usability and efficiency of the Incident form in ServiceNow. The project uses Client Scripts and UI Policies to control the behavior of fields dynamically based on specific conditions.

Problem Identification

In the Incident Management system, users need to enter different types of information while creating or updating an incident. If all fields behave in the same way, users may have difficulty identifying which information is required. Some fields may need to be mandatory, visible, hidden, or read-only depending on the incident details.

Therefore, a solution is needed to make the Incident form more dynamic and user-friendly.

Proposed Idea

The proposed idea is to implement Client Scripts and UI Policies on the Incident table. These features can change the behavior of Incident form fields according to predefined conditions.

For example, based on the values entered by a user, a field can be made mandatory, visible, or read-only. Client Scripts can also be used to perform client-side actions and validations when users interact with the form.

Objectives

The main objectives of the project are:

- To improve the usability of the Incident form.
- To dynamically control Incident form fields.
- To make required fields mandatory when necessary.
- To control field visibility based on conditions.
- To make specific fields read-only when required.
- To reduce incorrect or incomplete Incident information.
- To improve the overall Incident management process.

Expected Benefits

The implementation of Client Scripts and UI Policies helps provide a more structured Incident form. Users can clearly understand which information is required, while unnecessary fields can be controlled based on specific conditions. This can reduce manual effort and improve the consistency of Incident data.

Conclusion

The brainstorming and ideation phase identifies the need for a more dynamic and user-friendly Incident form in ServiceNow. The proposed implementation of Client Scripts and UI Policies provides a suitable approach for controlling field behavior and improving the Incident management experience.
