

PHASE 5 – PROJECT DEVELOPMENT PHASE

Project Title

Implement Client Script & UI Policy (Incident)

Objective

The objective of this phase is to implement the planned Client Scripts and UI Policies on the ServiceNow Incident form. The development focuses on dynamically controlling Incident fields according to the defined conditions.

Development Process

The project is developed in the following steps:

1. Open the ServiceNow platform.
2. Navigate to the Incident module.
3. Open the Incident form.
4. Identify the fields that require dynamic behavior.
5. Create the required Client Script.
6. Configure the appropriate Client Script type and conditions.
7. Add the required JavaScript logic.
8. Create the required UI Policy.
9. Configure the UI Policy conditions.
10. Configure the required UI Policy Actions.
11. Save and activate the configurations.
12. Test the Incident form.

Client Script Implementation

The Client Script is configured for the **Incident** table to perform actions on the form based on user interaction or specific form events.

The Client Script can be configured using appropriate script types such as:

- **onLoad** – executes when the Incident form loads.
- **onChange** – executes when a field value changes.
- **onSubmit** – executes when the form is submitted.

The required JavaScript logic is added according to the project requirement.

UI Policy Implementation

A UI Policy is created for the **Incident** table to control field behavior based on predefined conditions.

The UI Policy Actions are configured to control fields as required:

- **Mandatory** – requires the user to enter information.
- **Visible** – displays the required field.
- **Read-only** – prevents the user from modifying the field.

Implementation Flow

Incident Form → Apply Condition → Client Script / UI Policy → Execute Action → Field Behavior Changes → User Enters Information → Submit Incident

Solution

The implemented Client Scripts and UI Policies provide dynamic control over the Incident form. When the configured conditions are met, the appropriate field behavior is automatically applied without requiring the user to manually change the field properties.

Expected Outcome

The completed development provides a functional Incident form where fields respond according to the configured Client Script and UI Policy conditions. This improves the consistency of Incident data and makes the form easier for users to work with.

Conclusion

The development phase implements the planned Client Scripts and UI Policies in ServiceNow. The completed configuration provides the required dynamic field behavior and prepares the project for the testing phase.
