

PHASE 6 – PROJECT TESTING PHASE

Project Title

Implement Client Script & UI Policy (Incident)

Objective

The objective of this phase is to test the implemented **Client Scripts and UI Policies** on the ServiceNow Incident form and verify that all configured field behaviors work correctly according to the project requirements.

Testing Process

The Incident form is tested under different conditions to ensure that the Client Scripts and UI Policies perform the expected actions.

The testing process includes:

1. Open the Incident form.
2. Enter the required Incident details.
3. Change the relevant field values.
4. Verify the Client Script behavior.
5. Check the UI Policy conditions.
6. Verify field visibility.
7. Verify mandatory field behavior.
8. Verify read-only field behavior.
9. Test form submission.
10. Record the test results.

Test Cases

Test Case	Test Action	Expected Result
Test Case 1	Open the Incident form	Incident form should load correctly
Test Case 2	Change the configured field value	Client Script should execute correctly
Test Case 3	Meet the UI Policy condition	Configured field behavior should be applied
Test Case 4	Check mandatory field	Field should become mandatory when required
Test Case 5	Check field visibility	Field should be displayed or hidden according to the condition
Test Case 6	Check read-only behavior	Configured field should not be editable
Test Case 7	Submit the Incident	Required information should be validated
Test Case 8	Test normal Incident condition	Form should work without unexpected behavior

Client Script Testing

The Client Script is tested by performing the relevant actions on the Incident form. The configured script should execute at the appropriate form event and perform the expected action.

The testing verifies that the script does not produce unexpected behavior or errors.

UI Policy Testing

The UI Policy is tested by applying the configured conditions on the Incident form. The corresponding UI Policy Actions are checked to confirm whether fields become:

- **Mandatory**
- **Visible**
- **Read-only**

The results are compared with the expected behavior.

Expected Test Result

The Client Scripts and UI Policies should execute successfully according to their configured conditions. The Incident form should dynamically respond to user actions, and the required field behavior should be applied correctly.

Testing Outcome

After completing the test cases, the Incident form configuration is verified for correct functionality. Any issues identified during testing can be corrected before the final project demonstration.

Conclusion

The testing phase verifies that the Client Scripts and UI Policies implemented on the Incident form work as expected. Successful testing confirms that the project is ready for the final documentation and demonstration phases.
