

## **PHASE 7 – PROJECT DOCUMENTATION PHASE**

### **Project Title**

Implement Client Script & UI Policy (Incident)

### **Objective**

The objective of this phase is to prepare complete documentation for the Implement Client Script & UI Policy (Incident) project. The documentation records the project requirements, design, development process, testing activities, and final results in a structured manner.

### **Project Overview**

The project focuses on improving the ServiceNow Incident form using Client Scripts and UI Policies. These ServiceNow features are used to dynamically control the behavior of Incident form fields based on predefined conditions.

Client Scripts allow client-side actions to be performed when specific form events occur. UI Policies help control field properties such as visibility, mandatory status, and read-only behavior.

### **Problem Statement**

The Incident form contains several fields that are used to record information about an incident. Depending on the situation, some fields may need to be displayed, made mandatory, or restricted from editing.

Without proper field control, users may enter incomplete or inappropriate information. Therefore, a dynamic configuration is required to improve the usability and consistency of the Incident form.

### **Proposed Solution**

The proposed solution is to implement Client Scripts and UI Policies on the Incident table.

The Client Scripts perform the required client-side actions based on appropriate form events. UI Policies control field properties according to predefined conditions.

The solution provides a structured and dynamic Incident form that responds to user actions.

### **Technologies and Components Used**

**Platform:** ServiceNow

**Application:** Incident Management

**Table:** Incident

### **Configuration Components:**

- Client Scripts
- UI Policies

- UI Policy Actions
- JavaScript

### **Implementation Summary**

The project was implemented by first analyzing the Incident form requirements. The required fields and conditions were identified.

Client Scripts were then configured according to the required form events. The necessary JavaScript logic was added to perform the required client-side actions.

UI Policies were created for the Incident table. Appropriate conditions and UI Policy Actions were configured to control field behavior.

The implemented configuration was then tested using different Incident scenarios.

### **Testing Documentation**

Testing was performed to verify the functionality of the implemented configuration.

The following areas were tested:

- Incident form loading
- Client Script execution
- UI Policy conditions
- Field visibility
- Mandatory field behavior
- Read-only field behavior
- Form submission
- Different Incident conditions

The test results were recorded and compared with the expected behavior.

### **Project Results**

The completed project provides dynamic control over the Incident form. The configured Client Scripts and UI Policies respond according to the defined conditions.

The implementation helps users understand which information is required and controls the behavior of selected fields during Incident creation and modification.

### **Documentation and Evidence**

The following materials should be included as project evidence:

- Incident form screenshots
- Client Script configuration screenshots
- Client Script code screenshots

- UI Policy configuration screenshots
- UI Policy Action screenshots
- Testing screenshots
- Final output screenshots

These screenshots provide evidence of the implementation and testing completed during the project.

### **Expected Outcome**

The documentation provides a complete record of the Implement Client Script & UI Policy (Incident) project. It explains the purpose, requirements, implementation, testing, and results of the project in a structured format.

### **Future Enhancements**

The project can be further enhanced by adding additional Client Scripts and UI Policies for different Incident scenarios. More advanced validation and automation can also be introduced to improve Incident data quality and user experience.

### **Conclusion**

The documentation phase organizes all important information related to the project. It provides a complete reference of the Client Script and UI Policy implementation, including its design, development, testing, and results. This documentation also supports the final project demonstration and submission.
