

PHASE 8 – PROJECT DEMONSTRATION PHASE

Project Title

Implement Client Script & UI Policy (Incident)

Objective

The objective of this phase is to demonstrate the completed Implement Client Script & UI Policy (Incident) project. The demonstration explains the implemented Client Scripts and UI Policies and shows how they dynamically control the Incident form based on predefined conditions.

Project Demonstration Overview

The project demonstration focuses on showing the working functionality of the ServiceNow Incident form. The configured Client Scripts and UI Policies are demonstrated using different Incident scenarios.

The demonstration shows how field properties and form behavior change according to the defined conditions.

Demonstration Preparation

Before starting the demonstration, the required ServiceNow environment and Incident application were opened.

The following components were verified:

- Incident table
- Client Scripts
- UI Policies
- UI Policy Actions
- JavaScript logic
- Required Incident form fields

Demonstration Process

The project was demonstrated by performing the following steps:

1. Open the ServiceNow Incident application.
2. Navigate to the Incident form.
3. Create or open an Incident record.
4. Enter the required Incident information.
5. Change the field values according to the defined conditions.

6. Observe the Client Script execution.
7. Observe the changes made by the UI Policies.
8. Verify field visibility and mandatory behavior.
9. Verify read-only field behavior.
10. Submit or update the Incident record.
11. Verify the final result.

Client Script Demonstration

The configured Client Scripts were demonstrated using the appropriate Incident form events.

The demonstration shows how JavaScript logic executes on the client side and performs the required actions when the specified conditions are met.

The following Client Script functionality was demonstrated:

- Form loading behavior
- Field value changes
- Client-side validation
- Dynamic field behavior
- Required JavaScript actions

UI Policy Demonstration

The configured UI Policies were demonstrated by changing the relevant Incident field values.

The demonstration verifies that the UI Policies correctly control the selected fields.

The following behaviors were demonstrated:

- Field visibility
- Mandatory field status
- Read-only field status
- Dynamic field changes based on conditions

Testing During Demonstration

Different Incident scenarios were used during the demonstration to verify the implemented functionality.

The following were demonstrated:

- Normal Incident creation
- Different field conditions
- Client Script execution
- UI Policy execution
- Mandatory field validation
- Read-only field behavior
- Form submission

Demonstration Results

The demonstration successfully shows the working functionality of the Client Scripts and UI Policies implemented on the Incident form.

The Incident form responds dynamically according to the configured conditions. The required fields are controlled appropriately, helping maintain consistency and improving the user experience.

Demonstration Evidence

The following screenshots or evidence can be included for the project demonstration:

- Incident form before applying conditions
- Incident form after applying conditions
- Client Script configuration
- Client Script execution
- UI Policy configuration
- UI Policy Action configuration
- Field visibility changes
- Mandatory field changes
- Read-only field changes
- Final Incident form output

Expected Outcome

The project demonstration provides a clear understanding of how the implemented Client Scripts and UI Policies work in the ServiceNow Incident form.

It demonstrates the complete functionality of the project and verifies that the configured conditions and field behaviors work as expected.

Phase Conclusion

The demonstration phase presents the completed Implement Client Script & UI Policy (Incident) project in a practical manner. It verifies the implemented configurations through different Incident scenarios and demonstrates the final working output of the project.
