

Project Overview

Objective

The primary objective is to implement Client Scripts and UI Policies on the Incident form so that fields behave dynamically, mandatory information is enforced, and user input is validated instantly, ensuring accurate and consistent incident records.

Scope

The project covers the design, configuration, and testing of Client Scripts (such as onChange and onSubmit) and UI Policies (mandatory, read-only, and visible actions) on the Incident table in ServiceNow.

Problem Statement

Description

Incident forms without dynamic behavior allow missing or invalid data, show irrelevant fields, and let users edit fields that should be locked. This leads to poor data quality, rework, and delays in incident resolution.

Impact

Solving these issues will result in improved data quality, reduced manual errors, a smoother form experience, and faster incident handling, contributing to user satisfaction and better service management.

Proposed Solution	
Approach	Using ServiceNow UI Policies for no-code field control (mandatory, read-only, visible) and Client Scripts (JavaScript) for custom validation and logic that runs in the user's browser on the Incident form.

Project Initialization and Planning Phase

Date	30 September 2026
Team ID	SWTID-2026-5283
Project Title	Implement Client Script & UI Policy (Incident)
Maximum Marks	4 Marks

Project Proposal (Proposed Solution) report

The proposal report aims to improve the incident logging experience on the ServiceNow platform using Client Scripts and UI Policies. It tackles inconsistent and incomplete incident data, promising cleaner records, faster form completion, and fewer errors for both callers and support agents. Key features include dynamic field behavior and real-time validation on the Incident form.

Key Features	- Implementation of UI Policies to make fields mandatory, read-only, or hidden based on conditions. - Client Scripts (onChange, onLoad, onSubmit) for real-time validation and auto-populated values. - Instant user feedback through field messages and alerts before the record is saved.

Resource Requirements

Resource Type	Description	Specification/Allocation
Hardware		
Computing Resources	CPU/GPU specifications, number of cores	Standard laptop/desktop, no GPU required
Memory	RAM specifications	8 GB
Storage	Disk space for data, models, and logs	256 GB SSD
Software		
Platform	Cloud-based low-code platform	ServiceNow Personal Developer Instance (PDI)
Scripting Language	Client-side scripting	JavaScript (g_form, g_user APIs)
Development Environment	IDE / Tools	ServiceNow Studio, Script Editor, Chrome/Edge browser
Data		
Data	Source, size, format	ServiceNow Incident table, sample test records, in-platform records
