

Data / Storage Layer

ServiceNow Database: Incident table, sys_script_client, sys_ui_policy, sys_user

Solution Architecture

Date	30 September 2026
Team ID	SWTID-2026-5283
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	4 Marks

Solution Architecture Diagram:

High-level visual representation of the solution's architecture for Implement Client Script & UI Policy (Incident), mapping the Presentation Layer, Application Layer and Data Layer.

Component Description Table

Component Name	Description / Role in Architecture	Technologies Used
Presentation Layer	ServiceNow Incident form that users (callers, agents) interact with in the browser. Client Scripts and UI Policies execute here to show/hide, make mandatory or read-only, and validate form fields in real time without a server round trip.	ServiceNow Incident Form (Classic UI / Now Experience), Service Portal, HTML/CSS, JavaScript
API Gateway / Load Balancer	Receives all browser and API requests to the ServiceNow instance over HTTPS, distributes load across application nodes and routes calls to the platform's REST / Table API.	ServiceNow Instance Web Server, Load Balancer, REST / Table API, HTTPS
Auth Service	Authenticates users and enforces role-based access so that only authorised users can view or change Incident fields and manage scripts and policies.	ServiceNow Users & Roles, ACLs, SSO / SAML, Session Management
Core Logic Service	Holds the business logic of the project: Client Scripts (onLoad, onChange, onSubmit) run validations and field behaviour; UI Policies control field visibility, mandatory and read-only state; GlideAjax / Business Rules fetch or enforce data on the server when needed.	Client Scripts, UI Policies, UI Policy Actions, GlideForm (g_form), GlideAjax, Business Rules, JavaScript
External API Integrations	Optional connections to outside services, such as sending email notifications when an Incident is created or updated.	Email Notifications, REST Messages / Integration Hub
Database	Stores Incident records together with the Client Script and UI Policy definitions and user data, and returns them to the platform on request.	ServiceNow Database: Incident (incident), Client Script (sys_script_client), UI Policy (sys_ui_policy), User (sys_user)
